General description

1. The format of this list follows the general outline published in *Acta Crystallographica* (1971) **A**27, 393–396 and *Journal of Applied Crystallography* (1971) **4**, 264–267. As for the previous lists it is based on the use of standard 80-column punched cards.
2. Normally each program should be a discrete entity capable of being run by itself, even if included in a system. It should have been tested carefully and used successfully under various conditions until the authors are satisfied that maximum debugging has been achieved.
3. Each program is described as follows:
   A. A title line containing the essential information pertaining to the program in a very compressed form. This line has been given an accession number to be used as an index and reference.
   B. Name and source line containing all personal references related to authors and sources.
   C. From 1 to 6 lines of more detailed description giving information which cannot be identified from the title line.
4. The IUCr *World List* has been organized as follows:
   A. Direct listing of the cards as supplied by the authors:
      * Title line with accession number.
      * Name and source line.
      * Description and general information.
   B. Reference table, made of all the title lines with accession numbers. These are printed in ascending dictionary order of the following three types combined:
      * Machine type.
      * Language.
      * Crystallographic computing system.
5. A dictionary of the abbreviations is printed in alphabetic order of the symbols supplied either by the Editor or by the authors.
6. An index of authors is listed from the author index cards.
