Totality from France

Harwell Campus

- The UK's national synchrotron facility, open from 2007 to researchers in universities and industry, and co-owned and funded by the UK government through STFC and the Wellcome Trust (86:14 ratio).
- A total of 12,000 registered users, and more than 100 companies paying for proprietary use.
- 33 operational beamlines
- First scientific users from 2007

Diamond Beamlines and Science Groups

Large data generating MX beamlines

- I04-1 (XCHEM)
- I04 (micro, UDC)
- I03 (UDC)
- I24 (micro, SSX)

EXECUTIVE OFFICE OF THE PRESIDENT
OFFICE OF SCIENCE AND TECHNOLOGY POLICY
WASHINGTON, D.C. 20502

August 25, 2022

MEMORANDUM FOR THE HEADS OF EXECUTIVE DEPARTMENTS AND AGENCIES

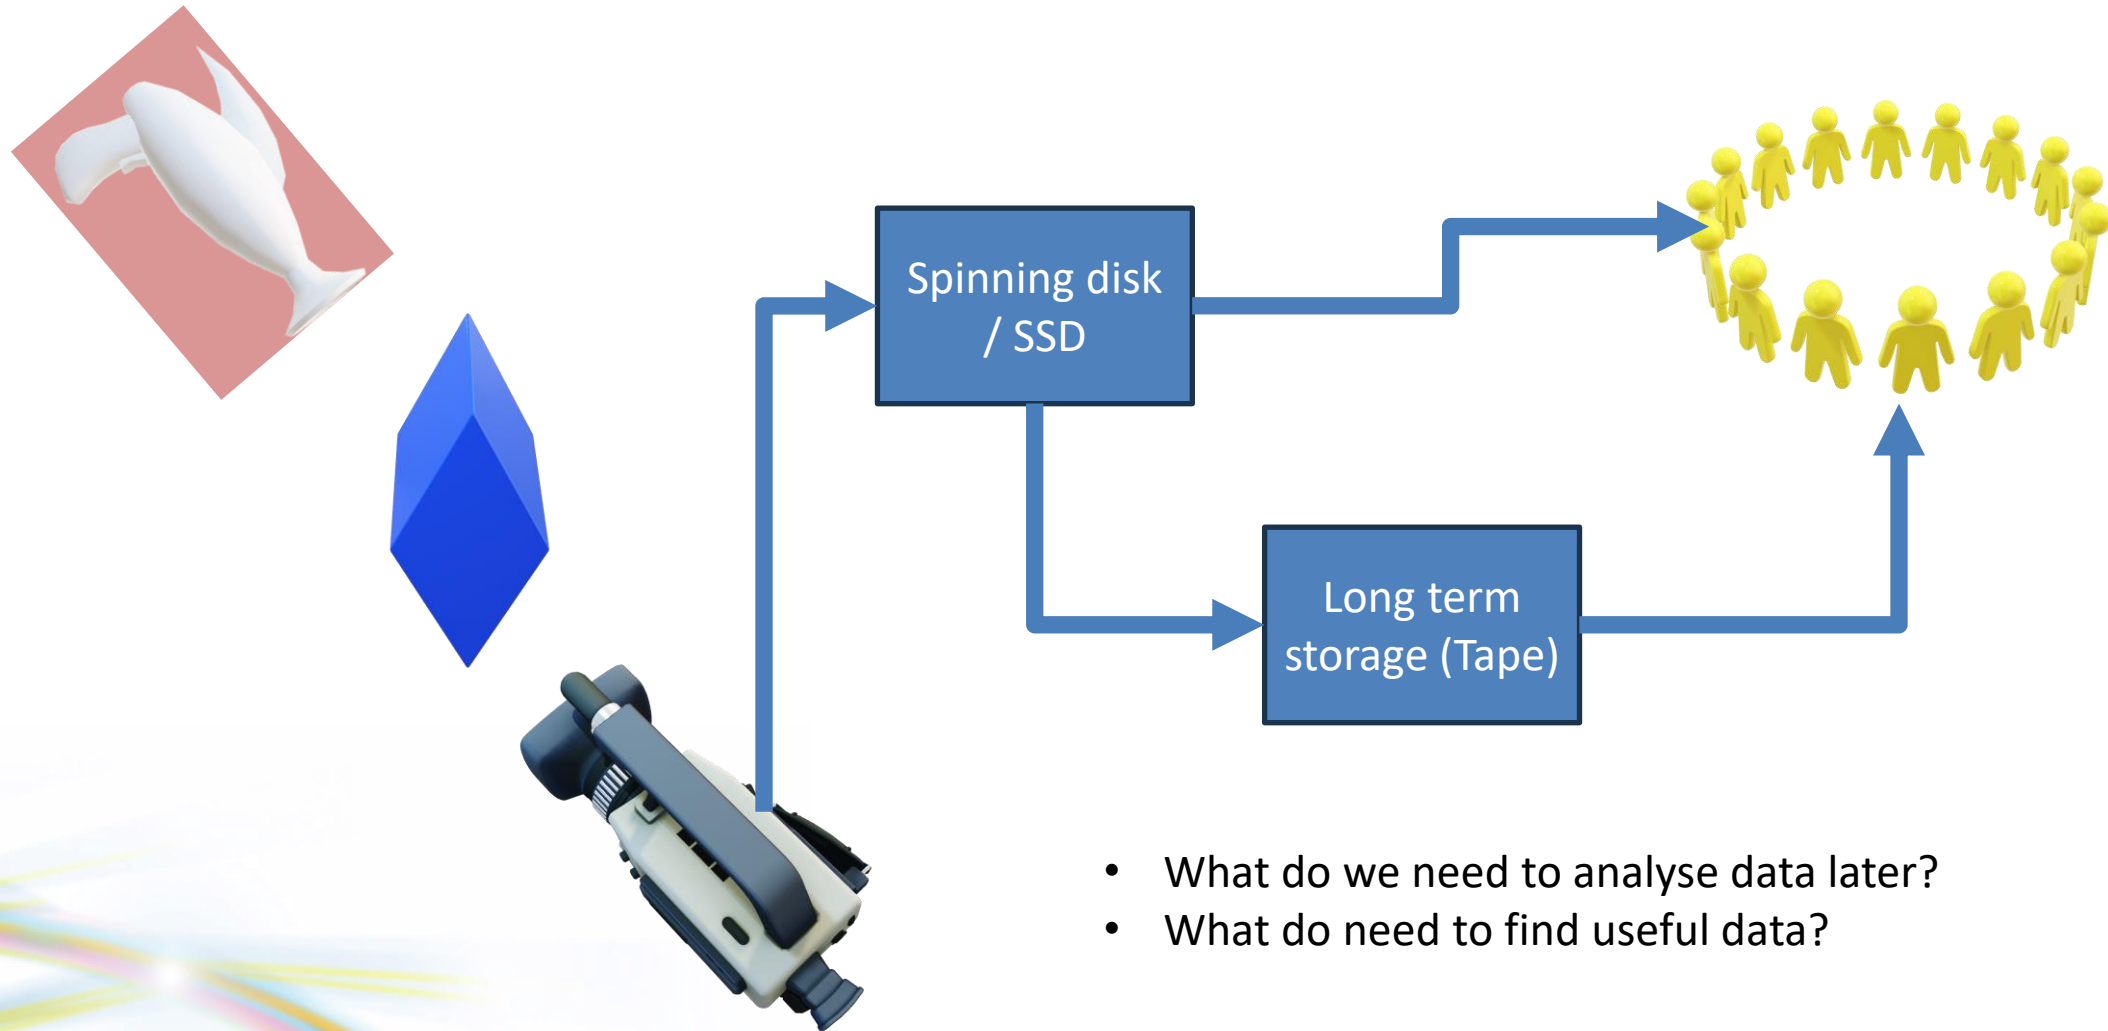

FROM: Dr. Alondra Nelson 
Deputy Assistant to the President and Deputy Director for Science and Society
Performing the Duties of Director
Office of Science and Technology Policy (OSTP)

SUBJECT: Ensuring Free, Immediate, and Equitable Access to Federally Funded Research

This memorandum provides policy guidance to federal agencies with research and development expenditures on updating their public access policies. In accordance with this memorandum, OSTP recommends that federal agencies, to the extent consistent with applicable law:

1. Update their public access policies as soon as possible, and no later than December 31st, 2025, to make publications and their supporting data resulting from federally funded research publicly accessible without an embargo on their free and public release;
2. Establish transparent procedures that ensure scientific and research integrity is maintained in public access policies; and,
3. Coordinate with OSTP to ensure equitable delivery of federally funded research results and data.

Data storage

- What do we need to analyse data later?
- What do need to find useful data?

Multi-crystal cubic insulin example data set recorded on i24

 Winter, Graeme

Data collector(s)

 Winter, Graeme

Researcher(s)

Bertram, Felicity

Data collected as part of routine commissioning on Diamond Light Source beamline i24 15th August 2022 with samples prepared by Felicity Bertram at Diamond following standard techniques. Data are individually incomplete but combined make for a reasonably complete and reasonable data set.

Purpose of the data upload is to make data available for tutorials using the DIALS toolchain (see e.g. examples at https://github.com/graeme-winter/dials_tutorials) however data are available for all purposes without limitation.

Raw

Processing in Detail (Diamond / CCP4 2022)

Introduction

DIALS processing may be performed by either running the individual tools (spot finding, indexing, refinement, integration, symmetry, scaling, exporting to MTZ) or you can run `xia2`, which makes informed choices for you at each stage. In this tutorial we will run through each of the steps in turn, taking a look at the output as we go. We will also look at enforcing the correct lattice symmetry.

The aim of this tutorial is to introduce you to the tools, not teach about data processing - it is assumed you have some idea of the overall process from e.g. associated lectures. With the graphical tools, I am not making so much effort to explain the options as simply "playing" will give you a chance to learn your way around and also find the settings which work for you. Particularly with looking at diffraction images, the "best" settings are very personal.

https://github.com/graeme-winter/dials_tutorials/blob/main/insulin/processing_in_detail.md

Current DLS situation

- DLS has changed its policy from April 2019
 - Academic funded data collected thereafter would be made public from March 2022
 - Data owners being told 6 months in advance of such
 - DLS has not yet released any data but still has the intention to do it
 - Data prior to April 2019, DLS has not yet deleted any data, but such data would be only available at the explicitly request of the data owner

- How useful would be to have that raw data available?
 - 2021 submitted 3 Months summer student project to investigate this
 - Student started worked June to September 2022

Can we investigate DLS data and see usefulness?

- Are our instruments getting better?
- Are we collecting more but also efficiently ?
- How many collections until the publishable final dataset ?
- What is the phasing vs MR trends?
- Can it inform where we should direct software and hardware development on our I04 beamline and MX in general?
- Calculate how many datasets of the same protein are required before a structure is deposited for that structure
- Identify (prototyping on I04 beamline) datasets that have been solved prior to the dataset used in the PDB deposition
- Improve our Unattended Data collections recipes and strategies
